Supplemental Handout – Neighborhood Effects and Smoking during Pregnancy in Maine: The Influence of Social and Community Context

Presenter: Emily Morian-Lozano
Presentation Date: June 6, 2017

Concentrated Disadvantage:

- Data Source: American Community Survey, U.S. Census Bureau
- Standardized measure of disadvantage, calculated using five variables:
  - Percent of individuals living below the poverty line
  - Percent of individuals on public assistance
  - Percent female-headed households
  - Percent unemployed
  - Percent less than 18
- Z scores are calculated for each variable by census tract
- All five z scores are averaged for each census tract, which became that census tract’s Concentrated Disadvantage Index Score
- The Concentrated Disadvantage Index Scores for each census tract are divided into quartiles:
  - 1 = Low Concentrated Disadvantage
  - 2 = Medium-Low Concentrated Disadvantage
  - 3 = Medium-High Concentrated Disadvantage
  - 4 = High Concentrated Disadvantage
- High Concentrated Disadvantage is associated with risky health behaviors and adverse health outcomes

For more detailed methods, please visit the AMCHP Life Course Indicators Online Tool at: http://www.amchp.org/programsandtopics/data-assessment/Pages/LifeCourseIndicators.aspx. Concentrated Disadvantage is listed under “Community Wellbeing.”
